Unit 4 : Session 11 : SLO 1 | UDP Socket Behaviour

■ I. Fill in the Blanks

1. UDP does not guarantee reliable or ordered delivery (packets may be lost, duplicated or arrive out of order).
2. `sendto()` is used to send data along with a destination address (host, port) as UDP has no connection to default to.

■ II. Multiple Choice

1. b) Unreliable and fast as UDP trades reliability for minimal overhead and low latency.
